“Great in Grass”

The *NEWEST* Spring Oat for forage!

Magnum forage Oats

Magnum Oats are very tall and prolific forage, producing a high volume of plant material of very high quality hay and/or greenchop for all livestock. The height of the *Magnum*, six feet or taller, along with its density make it the most impressive forage oat available in the market place today. Once *magnum* oats are introduced into a geographic growing area, repeat sales the following year readily occur because its performance is so impressive.

Magnums forage and hay are very sweet and even with the larger straw, cattle and horses will readily clean up the feed trough. *Magnum* oats are small seeded, with good seedling vigor and great tillering. This variety has rapid elongation with broad leaves growing upright to produce a large almost bushy plant. If left ungrazed and with good growing conditions *Magnum* Oats can reach five feet at the head emergence and will exceed five feet after full heading. Yields have ranges from 3.5 to 4.0 tons per acre at boot stage and increase up to 5.0 tons per acre and more at soft dough stage. We have seen yields up to 7.0 tons per acre, but consistent averages are in the 5.0 ton area.

With a seed count of 18,000 to 20,000 seeds per pound a grower can generally cut the planting rate to 50% of common oats. Commonly *Magnums* are seeded from 50# to 75# per acre. *Magnum* oats can be planted in combination with *Magnus* peas to increase protein. Blends with *Forerunner* triticale and Turnips increase forage production and extends grazing periods. The old walken oats won't even stand a chance against *Magnum*. *Magnum* oats are grown under P.V.P and unauthorized propagation is prohibited.
